

ANGULAR PROJECT: RECIPE OPTION

Task: Use the Edamam API to build an Angular app for searching and saving recipes.

API: <https://developer.edamam.com/>

Build Specifications

1. Allow users to filter recipes based on at least three criteria (e.g.: text search, dietary restrictions, calories).
2. Display recipes that match the user's selected criteria.
3. Allow users to select individual recipes to see more details on your site.
4. Allow users to click a link to see the recipe on their original source site.
5. Allow users to mark recipes from the results for a favorites list.
6. Include a separate route where users can
 - a. See a list of recipes they've marked for the favorites list
 - b. Select individual recipes to see more details
 - c. Remove recipes from the favorites list
7. Do not implement log in. Built as if a user is already logged in.
8. Use at least three components:
 - a. **searchCriteria** the criteria selection
 - b. **recipeList** for the list of results
 - c. **favoritesPage** for the favorites list route
9. As always, develop mobile-first with additional optimizations for desktop experience.
